

Digilock DG-Gateway

The DG-Gateway sends and receives data streams via the internet router and then transmits information to the locks. Gateways should be installed within a maximum range of 50 feet (approx. 15.25 meters) from the locks. If the building layout allows, they should be mounted within line of sight of the locks. It is recommended to install the DG-Gateway on the ceiling to prevent potential obstacles that could block the signal to the lock.
